## **Top 5 percent crash sites**

Date Requested: Date Provided: 20 March 2024 2 April 2024

## Request

Can you please provide a list of the top 5% of crash sites (including how many crashes) in Christchurch?

## **Council Response**

Please find attached a spreadsheet listing the top 5% intersections in the city in terms of Collective Risk based on calculated DSI equivalents.

- Column A is the intersection name.
- Column B is the number of death or serious injury crashes (DSI) in the past 5 years.
- Column C is the number of death or serious injury crashes (DSI) in the past 10 years.
- Column D is for the past 10 years, the total number of crashes that resulted in injury minor, serious, or fatal. Non-injury crashes are not used for this analysis.
- Column E is the calculated Collective Risk band, the calculation is based on the injury crashes and the movement types of each of those crashes (as some types of crashes result in death or serious injury more often than other types). "Actual High" means that the actual recorded number of DSI crashes exceeded a specific threshold.

## Things to note:

Please note the following when viewing the attached information.

- This analysis does not include crash sites which occur midblock eg. a high risk bend.
- This is high level analysis based on crash movement coding, and does not replace a site specific crash analysis.
- This does not include crashes that did not result in injury, and does not include unreported crashes (crashes, particularly the less severe ones, are known to be underreported).
- The total number of intersections analysed is 6048.
- As the analysis is based upon 10 years of crash history, there can be some intersections on this list which have had network changes or safety improvements in recent years, but still appear on the list.
- More detail about how collective risk is defined and calculated can be found here: <u>https://www.kiwirap.org.nz/measures\_risk.html</u>
